## Application of Partial differential Equations

### Classification of linear partial differential equation of second order

The general form of

$$A \frac{\partial^2 u}{\partial x^2} + B \frac{\partial^2 u}{\partial x \partial y} + C \frac{\partial^2 u}{\partial y^2} + f(x, y, u, \frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}) = 0$$

A, B, C are constant or continuous function  
of x and y, A is  $\neq 0$ .

Now Equation is :-

Equation 1) Elliptic if  $B^2 - 4AC < 0$

Equation 2) Hyperbolic if  $B^2 - 4AC > 0$

Equation 3) Parabolic if  $B^2 - 4AC = 0$

$$\frac{\partial u}{\partial z^2} + \frac{\partial^2 u}{\partial z \partial t} + \frac{\partial^2 u}{\partial t^2}$$

$$A = \pm ; B = \pm ; C = 1$$

$$B^2 - 4AC \Rightarrow (1)^2 - 4(1)(1) \Rightarrow -3$$

$-3 < 0$  so it is elliptic

$$\textcircled{1} \frac{\partial u}{\partial z^2} + 4 \frac{\partial^2 u}{\partial z \partial t} + \frac{\partial^2 u}{\partial t^2}$$

$$A = 4 ; B = 4 ; C = 1$$

$$B^2 - 4AC \Rightarrow 16 - 16 = 0 \text{ is parabolic}$$

$$\textcircled{2} \frac{x^2 \partial^2 u}{\partial t^2} + \frac{\partial^2 u}{\partial x^2} + 4 = 0$$

$$A = x^2 ; B = 0 ; C = -1$$

$$B^2 - 4AC \Rightarrow \underline{9x^2} \rightarrow \text{depends on } x$$

here we consider all cases for  $x$

① if  $x > 0$  or  $x < 0$  implies curve is hyperbolic

② if  $x = 0$  curve parabolic

$$\textcircled{Q4} \quad \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial x \partial t} + \frac{\partial^2 u}{\partial t^2} = 0$$

$$A = x \quad B = t \quad C = 1$$

$$B^2 - 4AC \Rightarrow [t^2 - 4x]$$

if curve is elliptic  $t^2 < 4x$   
 is hyperbolic  $t^2 > 4x$   
 is parabolic  $t^2 = 4x$

Q5 Classify the following differential eq<sup>n</sup> as  
 into two types this is 2nd and  
 Quadrant of x-y plane.

$$\sqrt{y^2+x^2} U_{xx} + 2(x-y) U_{xy} + \sqrt{y^2+x^2} U_{yy} = 0$$

$$A = \sqrt{y^2+x^2} \quad B = 2(x-y) \quad C = \sqrt{y^2+x^2}$$

$$B^2 - 4AC = \frac{x^2}{y^2+x^2}$$

$$4(x-y)^2 - 4(\sqrt{y^2+x^2})(\sqrt{y^2+x^2})$$

$$4[x^2+y^2-2xy] - 4(y^2+x^2)$$

$$4[y^2+x^2-2xy-x^2-y^2] \Rightarrow -8xy$$

i) Hyperbolic as in 2nd quad  $\Rightarrow x \rightarrow -ve$   
 $y \rightarrow (+) ve$

# Method of Separation of Variables

In this method we assume the solution to be the product of two functions. Each of which involves only one of the variables.

Ques 1 Use the Method of Separation of Variables to solve the equation.

$$\frac{\partial u}{\partial x} = 2 \frac{\partial u}{\partial t} + u; \text{ given that } u(x, 0) = 6e^{-3x}$$

$$u = X(x)T(t)$$

Put this sol<sup>n</sup> in eq<sup>n</sup> ①

$$\frac{\partial (XT)}{\partial x} = 2 \frac{\partial (XT)}{\partial t} + XT$$

$$T \frac{dx}{dx} = 2X \frac{dT}{dt} + XT$$

dividing both sides by  $X T$

$$\frac{T}{X} \frac{dx}{dx} = \frac{2X}{T} \frac{dT}{dt} + X$$

$$\boxed{\frac{1}{X} \frac{dx}{dx} = \frac{2}{T} \frac{dT}{dt} + 1} = K$$

①

Point to Rem.

$$\frac{1}{x} \frac{dx}{dx} = K \Rightarrow \frac{dx}{x} = K dx$$

On integration

$$\log x = Kx + \log C$$

$$x = C_1 e^{Kx}$$

$$\frac{2}{T} \frac{dT}{dt} + 1 = K$$

$$\frac{2}{T} \frac{dT}{dt} = K - 1$$

$$\int \frac{1}{T} dT = \int \frac{(K-1)}{2} dt$$

$$\therefore \log T = (K-1) \cdot t + \log C_2$$

$$T = C_2 e^{\left(\frac{K-1}{2}\right)t}$$

$$u = X(x) T(t)$$

$$u(x,t) = C e^{Kx + \left(\frac{K-1}{2}\right)t}$$

$$\text{from our condition } u(x,0) = 6 e^{-3x}$$

$$\text{put } t=0 \quad \text{in } \quad (2)$$

$$u(x,0) = C e^{Kx}$$

$$u(x,0) = 6 e^{-3x}$$

$$u = 6 e^{-3x - 2t}$$

$$\log x = \log e^{Kx} + \log C$$

$$\text{as } \log e = 1$$

or

$$\frac{1}{x} \frac{dx}{dt} = K$$

$$\frac{dx}{dt} - Kx = 0$$

$$(D-K)x = 0$$

$$\left| \frac{1}{x} \frac{dx}{dx} = \frac{4}{Y} \frac{dy}{dy} - K \right|$$

$$\Rightarrow \frac{1}{x} \frac{dx}{dx} = K$$

$$\frac{4}{Y} \frac{dy}{dy} = K$$

$$\int \frac{dx}{x} = \int K dx$$

$$4 \frac{dy}{Y} = \frac{1}{K} \frac{dy}{dy}$$

$$\log x = Kx + \log C_1$$

$$4 \log Y = Ky + \log C_2$$

$$x = C_1 e^{Kx}$$

# 2-D heat flow

Consider the flow of heat in a metal plate in the  $XOY$  plane.

If the temperature at any point is independent of the  $Z$  co-ordinate and depends on  $X$ ,  $Y$  and  $T$  only. Then the flow is called two dimensional and the heat flow lies in the plane  $XOY$  only and zero along the normal ~~to~~ to the plane of  $XOY$ .

The 2-D heat flow eq<sup>n</sup> is

$$c^2 \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) = \frac{\partial u}{\partial t} \quad \text{Imp.}$$

## Transmission lines

- Consider the flow of electricity in an insulated cable.
- Let  $V$  be the potential and  $I$  the current at time  $t$  at a point  $P$  of the cable at a distance  $x$  from given point.
- Let  $R$ ,  ~~$L$~~ ,  $C$ ,  $G$  be respectively the resistance, inductance, capacitance and leakage to the ground per unit length of the cable.
- Each assumed to be constant.
